

MEMO – RE: MRET for Severe Burn, Wound, or Staph Infections

A. Because of greater hydration, super liquidity and antibacterial benefits, MRET water has been found to be a very effective treatment for severe burns and wounds.

Drinking MRET water will enhance immune system and cellular activity to counteract infections. More important, if the wound or burn area is fully immersed or soaked in MRET water, most pain should be dramatically diminished or even stopped, within 10 to 15 minutes of soaking. Thus, wound healing should be accelerated and infections should be significantly reduced.

B. In addition, direct application of the MRET Activator to the area of hard to heal wounds, long term ulcers, or even staph infections should accelerate healing and prevent or destroy harmful or invasive bacteria. The Applicator should not directly touch the wound or infected area, but should be kept $\frac{3}{4}$ to 1 inch away.

Note -- MRET Activator will not effectively penetrate plastic or other coverings, but light cotton or other natural fiber bandages or gauze coverings will be penetrated by the harmless MRET low frequency radio waves.

To date, most favorable results have been anecdotal, and thus more regulated control tests would be the next priority.
